EXPERIENCE

DeepAware AI (Robotics Center of Silicon Valley) · Robotics Intern San Francisco, CA · Jun 2026 – Aug 2026

- Built motor control and teleoperation software for the OpenArm robot arms, including simulated arm teleoperation driven from a Meta Quest. Shipped the control repository to clients with an emergency motor-kill hotkey.
- Built straight-line waypoint navigation for a Unitree Go2-W quadruped after the vendor lidar stack could not self-localize, and delivered the demo solo to a visiting client engineer.
- Consolidated a fragmented multi-repository codebase into one robot control repo with git submodules, a required-review workflow on main, and a one-command setup script for teammates unfamiliar with git.
- Ran the robot arm table and presented to roughly 200 people at the company Builders Conference.

Frizzle (Y Combinator S25) · Software Intern Remote · May 2026 – Aug 2026

- Built WarmStack, the company cold-email infrastructure, covering domains, mailboxes and deliverability at roughly 1,000 emails per day, then ported it into the main product repository.
- Launched a live outreach campaign for a public school district client. Roughly 600 of 1,091 contacts were emailed within 48 hours, with fixes shipped while it ran.
- Built a grant scraper and a schools contact scraper deployed on Render, and shipped an AI humanizer with a plagiarism checker as the closing deliverable.

PROJECTS

Juber · Lead Developer Jun 2026 – Present

Ride-share app for the Jain Center of Northern California. Supabase, Vercel, web and mobile.

- Lead developer, and run a six-person volunteer team hired from 10 applicants across 5 defined roles. Wrote the role profiles, ran the interviews, and recruited two board members as advisors.
- Built driver safety gates, rider live directions with queue-aware ETAs computed against the driver's real pickup order, and a mobile-first admin console.
- Reviewed a draft liability agreement and identified six substantive defects before it reached counsel. Re-costed the production stack against current vendor pricing, from an assumed \$300 per month to \$45–75.

Schoology tooling · sgy, jv, bim, Pace Aug 2026

- Built **sgy**, a Python command-line Schoology client, after the district declined to issue students an API key. Rejected existing tools on the grounds that the session token is httpOnly, then drove a headless browser profile against the internal JSON endpoints. Found three defects by using it, then generalized it for other districts under an MIT license.
- Built **jv**, which maps 537 files of a course site, and **bim**, which joins posted homework to the correct textbook pages. Built **Pace** on top of sgy: an assignment feed grouped by urgency and a grades view with weighted categories and inline hypothetical scores. React 19, Vite, Express, deployed on Vercel.

Trading systems Mar 2026 – Present

- Passed the Topstep evaluation in June 2026 and trade a live funded futures account. Built a mean-reversion system in Python against the Interactive Brokers API, with an eight-phase backtest pipeline, a historical replay harness, and live automation through TradingView webhooks.

TOOLS

Languages Python, JavaScript, TypeScript, Java, SQL

Web React, Node, Express, Vite, Next.js, Supabase, Vercel, Render

Robotics CAN bus, Raspberry Pi, Isaac Sim, Meta Quest, teleoperation

Practice Git and submodules, code review workflows, AI-assisted development (Claude Code, Cursor)

EDUCATION

Monta Vista High School · Class of 2030 Cupertino, CA

Accelerated placement in Algebra 2/Trigonometry and Spanish 2. Coursework in Java and Biology.

ACTIVITIES

- **Tabla**, Indian classical percussion. Preparing for Madhyama Poorna certification, November 2026. People's Choice award at the YJA convention talent show, July 2026.
- **Volunteering**. Runs a sanctioned President's Volunteer Service Award youth project through the Jain Center of Northern California.
- **FIRST LEGO League** robotics, Team ShortCircuit, 2020–2023.
